

Abstract:

A filler decorates an automobile insignia that defines at least one space. The filler includes an insert filling the space. The insert includes a colored layer. The colored layer can be a polyester or vinyl film. A lens overlays and connects to the outside of the colored layer. The lens has a relatively high refractive index. A magnet for attracting an automobile underlies and connects to the inside of the colored layer. The magnet is rubberized. An adhesive underlying the magnet can attach to an automobile. The adhesive can be double-sided tape.
